 ,法线 $y = 4(x-1) + \frac{1}{2}$

- 切线方程: $y = f'(x_0)(x x_0) + f(x_0)$
- 法线方程: $y = -\frac{1}{f'(x_0)}(x x_0) + f(x_0)$,(假设 $f'(x_0) \neq 0$)

例 (1) 求
$$f(x) = x^2$$
 在点 (1, 1) 处的切线、法线的方程.

(2) 求
$$g(x) = \frac{1}{x}$$
 在点 (2, 0.5) 处的切线、法线的方程.

解 (1)
$$f'(x) = 2x \Rightarrow f'(1) = 2$$
,所以

切线
$$y = 2(x-1) + 1 = 2x - 1$$
, 法线 $y = -\frac{1}{2}(x-1) + 1 = -\frac{1}{2}x + \frac{3}{2}$

(2)
$$g'(x) = -\frac{1}{x^2} \Rightarrow g'(2) = -\frac{1}{4}$$
, 所以

切线
$$y = -\frac{1}{4}(x-2) + \frac{1}{2} = -\frac{1}{4}x + 1$$
,法线 $y = 4(x-1) + \frac{1}{2} = 4x - \frac{7}{2}$

解 因为
$$y = \left| \frac{(x-1)(x-2)}{(x-3)(x-4)} \right|^{\frac{1}{2}}$$

 $\frac{1}{y} \cdot y' = \frac{1}{2} \left(\frac{1}{y-1} + \frac{1}{y-2} - \frac{1}{y-3} - \frac{1}{y-4} \right)$ 所以

 $\ln y = \frac{1}{2} \ln \left| \frac{(x-1)(x-2)}{(x-3)(x-4)} \right|$

两边对 x 求导: (注意: $(\ln |x - a|)' = \frac{1}{\sqrt{a}}$)

$$y' = \frac{y}{2} \left(\frac{1}{x-1} + \frac{1}{x-2} - \frac{1}{x-3} - \frac{1}{x-4} \right)$$

 $= \frac{1}{2} (\ln|x-1| + \ln|x-2| - \ln|x-3| - \ln|x-4|)$

解 因为
$$y = \left| \frac{(x-1)(x-2)}{(x-3)(x-4)} \right|^{\frac{1}{2}}$$
,所以两边取对数得:
$$\ln y = \frac{1}{2} \ln \left| \frac{(x-1)(x-2)}{(x-3)(x-4)} \right|$$

$$f' = (x^{\frac{1}{2}})' = \frac{1}{2}x^{-\frac{1}{2}}$$

微分在近似计算中的应用

设y = f(x)在点 x_0 处可微,则

$$f(x_0 + \Delta x) - f(x_0) = f'(x_0) \Delta x + o(\Delta x) \approx f'(x_0) \Delta x$$

得到如下近似估算公式: 当 Δx 很小时,与微分项相比,这一项可以忽略

$$\Delta y = f(x_0 + \Delta x) - f(x_0) \approx f'(x_0) \Delta x \qquad (当 \Delta x 接近0)$$

$$\mathbf{H} \diamondsuit f(x) = \sqrt{x}$$
,则

$$\sqrt{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1) \Delta x = \frac{1}{2} \cdot 0.05 = 0.025$$
$$f' = (x^{\frac{1}{2}})' = \frac{1}{2} x^{-\frac{1}{2}}$$

微分在近似计算中的应用

设y = f(x)在点 x_0 处可微,则

$$f(x_0 + \Delta x) - f(x_0) = f'(x_0) \Delta x + o(\Delta x) \approx f'(x_0) \Delta x$$

$$\Delta y = f(x_0 + \Delta x) - f(x_0) \approx f'(x_0) \Delta x \qquad (当 \Delta x 接近0)$$

例 1 计算 $\sqrt{1.05}$ 的近似值.

$$\mathbf{H} \diamondsuit f(x) = \sqrt{x}$$
,则

$$\sqrt{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1)\Delta x = \frac{1}{2} \cdot 0.05 = 0.025$$

所以 $\sqrt{1.05} \approx 1.025$.

$$f' = (x^{\frac{1}{2}})' = \frac{1}{2}x^{-\frac{1}{2}}$$

微分在近似计算中的应用

设y = f(x)在点 x_0 处可微,则

$$f(x_0 + \Delta x) - f(x_0) = f'(x_0) \Delta x + o(\Delta x) \approx f'(x_0) \Delta x$$

得到如下近似估算公式: 当 Δx 很小时,与微分项相比,这一项可以忽略

$$\Delta y = f(x_0 + \Delta x) - f(x_0) \approx f'(x_0) \Delta x$$
 (当 Δx 接近0)

例1 计算 $\sqrt{1.05}$ 的近似值.

$$\mathbf{m} \diamondsuit f(x) = \sqrt{x}$$
,则

$$\sqrt{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1)\Delta x = \frac{1}{2} \cdot 0.05 = 0.025$$

$$f' = (x^{\frac{1}{2}})' = \frac{1}{2}x^{-\frac{1}{2}}$$

例 2 计算 ³√1.05 的近似值.

解

$$\sqrt[3]{1.05}-\sqrt{1}$$

$$\mathbf{F}$$
 令 $f(x) = x^{\frac{1}{3}}$,则

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1)$$

$$\mathbf{m} \diamondsuit f(x) = x^{\frac{1}{3}}$$
,则

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1)\Delta x$$

$$\mathbf{m} \diamondsuit f(x) = x^{\frac{1}{3}}$$
,则

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1) \Delta x$$
$$f' = (x^{\frac{1}{3}})'$$

$$\mathbf{m} \diamondsuit f(x) = x^{\frac{1}{3}}$$
,则

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1) \Delta x$$
$$f' = (x^{\frac{1}{3}})' = \frac{1}{3}x^{-\frac{2}{3}}$$

$$\mathbf{m} \diamondsuit f(\mathbf{x}) = \mathbf{x}^{\frac{1}{3}}$$
,则

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1) \Delta x = \frac{1}{3} \cdot 0.05$$
$$f' = (x^{\frac{1}{3}})' = \frac{1}{3}x^{-\frac{2}{3}}$$

$$\mathbf{m} \diamondsuit f(x) = x^{\frac{1}{3}}$$
,则

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1) \Delta x = \frac{1}{3} \cdot 0.05 \approx 0.0167$$
$$f' = (x^{\frac{1}{3}})' = \frac{1}{3}x^{-\frac{2}{3}}$$

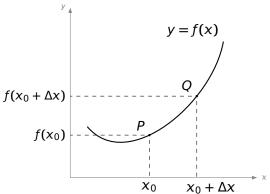

$$\mathbf{F}$$
 \mathbf{F} \mathbf{F} \mathbf{F} \mathbf{F} \mathbf{F} \mathbf{F} \mathbf{F}

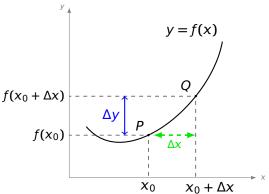

$$\sqrt[3]{1.05} - \sqrt{1} = f(1.05) - f(1) \approx f'(1) \Delta x = \frac{1}{3} \cdot 0.05 \approx 0.0167$$

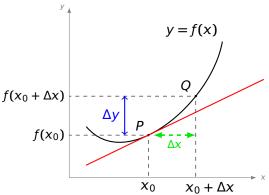

$$f' = (x^{\frac{1}{3}})' = \frac{1}{3}x^{-\frac{2}{3}}$$

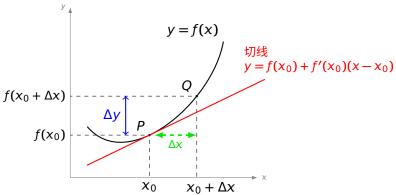

所以 $\sqrt{1.05}$ ≈ 1.0167.
